Equine polysaccharide storage myopathy (PSSM or EPSM) is a genetic condition in horses that affects how muscle cells partition, generate, and store energy. This can lead to exercise intolerance, stiffness, and an abnormal gait in your horse. After diagnosis, owners often notice signs, such as tail swishing, high resting muscle tone, behavioural changes, and ...

Thus it is unlikely that maximum methane losses and a close ratio of methane to hydrogen will occur simultaneously. In case of a 5 to 1 ratio, energy losses by hydrogen are approximately 6% of energy losses by methane. The highest methane losses reported in horses amount to 6.9% of DE . Corresponding energy losses by hydrogen are 0.4% of DE.

In terms of the "energy content" of feed, we are talking about the conversion of chemical energy into kinetic energy when the horse works. In food, energy is trapped in bonds between molecules and is released when the food is digested and the bonds are broken. The conversion of energy from food into a form the horse can utilise for work is
