CAES is very similar to pumped hydro power in storage concepts, however, usage of the stored air is different than simply releasing water through a turbine. CAES systems release the pressurized air by heating it in order to expand it, which then turns a turbine, generating electricity.⁶ This is done through two systems - diabatic or adiabatic

The focus of current studies lies on thermochemical heat storage concepts involving gas-solid reactions. Through such reactions, different materials can be employed as energy carriers for either heat transport or fuel production e.g. hydrogen or syngas (Agrafiotis et al., 2013, Lorentzou et al., 2015). Within a gas-solid reaction scheme, a solid is decomposed ...

Physical Principle: The hydrogen storage concept is based on producing, storing and transmitting H₂ to the user end via hydrogen pipelines, instead of relying on electrical cables. H₂ can be either reconverted in energy by means of fuel cells processes, or burned in gas-turbines adapted for hydrogen use.
