What's new in ABB's sustainable switchgear portfolio?

Another breakthrough for ABB's sustainable switchgear portfolio has been released to order: ABB has launched a ring main unit(RMU) with a groundbreaking load break switch (LBS) that uses sustainable alternative gases to SF6 for enhanced performance and reduced environmental impact.

Why should you choose ABB smart switchgear?

As one of the highest growing segments, commercial buildings require a very high level of energy efficiency and reliability. ABB smart switchgear is designed to satisfy the most challenging tasks of today's building sector.

Is ABB SF 6 better than AirPlus?

AirPlus is a fluoroketone-based gas mixture, with a 99.9 percent lower GWP compared to SF 6. In addition to AirPlus, ABB's eco-efficient portfolio also includes Dry Air, which is a natural gas and is suitable for lower voltage applications up to 12 kV. With the new LBS ABB's sustainable switchgear portfolio becomes even more attractive.

Is a flyback transformer a switched inductor?

The flyback transformer is a misnomer and ought to be considered as a switched inductor with coupling, as it does store energy unlike an ideal transformer. However the addition of a small air gap allows more current with greater H fields now occupied in the air gap. Not all the energy is in the gap but optimally it can be 2x as much as in the core.

What is ABB High Voltage Switchgear?

The ABB portfolio for gas-insulated high voltage switchgear comprises several modular designed model ranges for voltage ratings from 52 kV up to 1100 kV. More than 14000 installed bays in almost 2500 substations in over 70 countries demonstrate their value every day. This...

Should SF6 be replaced with eco-efficient alternatives in a puffer interrupter?

Replacing SF6 with eco-efficient alternatives in a puffer interrupter reduces interruption performance both in the thermal and dielectric phases (see following two sections) due to inferior arc-quenching properties and lower dielectric strength of alternative gases.

This system, in full operation since April 2022, can release and store energy with a fast response to keep the grid frequency within tightly controlled limits to ensure network stability. In addition to stabilizing the grid, the storage system also offers active support to the local Luna wind energy park. Here it acts as a short-term damper to ...

Resistors - kinetic energy is converted to thermal energy, inductors - kinetic energy is stored in a magnetic field, capacitors - potential energy is stored in an electric field from charges. Now connect a voltage source (i.e. battery) across an inductor with zero stored energy or a length of copper wire with parasitic inductance.
