The safe operation of the power grid system depends partly on regular inspections of transmission lines, in which the insulator is one of the most important inspections objects. The manual inspection of transmission lines is a chaotic process that is both time and cost-consuming since it involves an accurate manual inspection by an expert. For insulator ...

Due to the rapid advancement of technology and manufacturing industries, Unmanned Aerial Vehicle (UAVs) originally used for military applications, recently demonstrated the potentials for many new applications and investment opportunities, such as advanced cargo distribution [], surveillance and aerial photography [], disaster management [], search and ...

Small Format Aerial Photography is one of those niche areas for taking pictures from above to map our landscape. Traditionally, large format aerial cameras were used with 9" x 9" camera film to take vertical view of the landscape. For small formater aerial cameras, this means using 35 and 70mm film camera systems.

Target detection and tracking can be widely used in military and civilian scenarios. Unmanned aerial vehicles (UAVs) have high maneuverability and strong concealment, thus they are very suitable for using as a platform for ground target detection and tracking. Most of the existing target detection and tracking algorithms are aimed at conventional targets. ...

This paper explores the utility of aerial photographs for investigating landscapes of WWII conflict associated with the Normandy Campaign and the bombing of German military sites in northwest France during 1943 and 1944, and also the lesser known history of landscape ...

Unmanned aerial vehicle (UAV) object detection plays a crucial role in civil, commercial, and military domains. However, the high proportion of small objects in UAV images and the limited platform resources lead to the low accuracy of most of the existing detection models embedded in UAVs, and it is difficult to strike a good balance between detection ...
