An air compressor and an air receiver serve distinct functions in a compressed air system. The air compressor is responsible for generating compressed air by pressurizing it, while the air receiver is used to store the compressed air. The compressor delivers the pressurized air to the receiver, which acts as a buffer.

A crucial component in this process is the buffer tank which is a giant thermal battery. These well-insulated tanks, filled with water or a material with high thermal capacity, store the captured energy with minimal heat loss. When peak demand hits, the stored thermal energy is released from the buffer tank to meet cooling or heating needs,
