

What is wind-driven compressed air energy storage (CAES)?

With an increasing capacity of wind energy globally, wind-driven Compressed Air Energy Storage (CAES) technology has gained significant momentum in recent years. However, unlike traditional CAES systems, a wind-driven CAES system operates with more frequent fluctuations due to the intermittent nature of wind power.

What is compressed air energy storage (CAES)?

Compressed Air Energy Storage (CAES) can store surplus energy from wind generation for later use, which can help alleviate the mismatch between generation and demand. In this study, a small-scale CAES system, utilizing scroll machines for charging and discharging, was developed to integrate into a wind generation for a household load.

Can a wind-CAES tank be used to store compressed air?

As mentioned earlier, following the charging process, compressed air is stored under high-pressure. Thus, finding a location with high wind potential and suitable geologies for CAES storage components is critical for wind-CAES integration. Using an artificial tank for large-scale CAES storage proved not to be economically viable.

What are energy storage systems?

To ensure the stability, reliability, and dependability of power systems with significant wind capacity, the incorporation of energy storage systems (ESSs) is crucial. Various types of ESSs are available today, like batteries, flywheels, pumped hydro, fuel cells, etc.

Will compressed air energy storage be a trend in 2018?

The deployment of energy storage is a trend set to continue into 2018 and beyond. In the near future, compressed air energy storage (CAES) will serve as an integral component of several energy intensive sectors. However, the major drawback in promoting CAES system in both large and small scale is owing to its minimum turn around efficiency.

Can a small-scale energy storage system integrate into a household load?

In this study, a small-scale CAES system, utilizing scroll machines for charging and discharging, was developed to integrate into a wind generation for a household load. A simulation model, which was verified by our experiments results, was constructed for investigating the performance of the small-scale energy storage system.
