In the context of climate changes and the rapid growth of energy consumption, intermittent renewable energy sources (RES) are being predominantly installed in power systems. It has been largely elucidated that challenges that RES present to the system can be mitigated with energy storage systems (ESS). However, besides providing flexibility to intermittent RES, ...

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6] g. 1 shows the current global ...

Eligible energy storage systems must be larger than 1MW or 1MWh with a minimum discharge duration of 2

1 &#0183; The proliferation of community energy storage systems (CESSs) necessitates effective energy management to address financial concerns. This paper presents an efficient energy ...

Battery energy storage system (BESS) is widely used to smooth RES power fluctuations due to its mature technology and relatively low cost. However, the energy flow within a single BESS has been proven to be detrimental, as it increases the required size of the energy storage system and exacerbates battery degradation [3].The flywheel energy storage system ...
