Compressed air energy storage or simply CAES is one of the many ways that energy can be stored during times of high production for use at a time when there is high electricity demand.. Description. CAES takes the energy delivered to the system (by wind power for example) to run an air compressor, which pressurizes air and pushes it underground into a natural storage ...

In the designed system, the energy storage capacity of the designed CAES system is defined about 2 kW. Liquid piston diameter (D), length and dead length (L, L dead) is determined, respectively, 0.2, 1.1 and 0.05 m. The air tank capacity (V tank) is 0.5 m³. The equations used in system design and modeling are given below.

With the increase of power generation from renewable energy sources and due to their intermittent nature, the power grid is facing the great challenge in maintaining the power network stability and reliability.
