Add total bend radius of the heat pipe/VC. While not perfect this will get you very close to actual. Example: one 90 degree bend and another 45 degree bend = 135 degrees of bend; For each 10 degrees of bend Q_{max} will decline by .56%. In our example from above: 135 degree total bend divided by 10 multiplied by 0.56% = 7.6% decrease in Q_{max} .

Hot bending is generally only referring to different types of induction bending. Induction bending is a highly effective way of pipe bending, as it is fast, precise, and with few errors. The induction bending process is performed by heating a certain point of the pipe up where it then can be bent without much effort.
