Although steam is widely used in industrial production, there is often an imbalance between steam supply and demand, which ultimately results in steam waste. To solve this problem, steam accumulators (SAs) can be used as thermal energy storage and buffer units. However, it is difficult to promote the application of SAs due to high investment costs, which directly depend ...

One alternative to batteries is the concept of steam as energy storage. The idea itself is not new. It was

Storage tanks in similar service typically last for 20 or more years. ... since the heat from the wall coils is relatively small and the sweep steam provides additional energy to maintain the vapor temperature, at least in the region near the roof of the tank. In contrast, for the improved design, the effect of the flow rate of the sweep steam ...

A 500°C steam storage tank is 222 times more space efficient at storing energy than an accumulator as of 16.51 (215.56 times if ambient 15°C is taken into account but I didn't notice it having an effect in testing) and with Factorio physics, steam doesn't cool down.

While a steam tank holds 2.4-ish GJ, each heat pipe unit stores 0.5 GJ and a reactor 5GJ. So there's actually a massive energy buffer even with no tanks. Personally I just use a steam tank to gauge how much steam is inside the pipes, sending the result to the circuit network and eventually inserting fuel only when steam is lower than like 20k.
