Why do we need more energy storage?

3) We need to build a lot more energy storage. Good news: batteries are getting cheaper. While early signs show just how important batteries can be in our energy system, we still need gobs more to actually clean up the grid.

Can low-cost long-duration energy storage make a big impact?

Exploring different scenarios and variables in the storage design space, researchers find the parameter combinations for innovative, low-cost long-duration energy storage to potentially make a large impact in a more affordable and reliable energy transition.

How does energy storage work?

Currently, about 95% of the long-duration energy storage in the United States consists of pumped-storage hydropower: water is pumped from one reservoir to another at higher elevation, and when it's released later, it runs through turbines to generate electricity on its way back down. This simple method works well but is limited by geography.
