The three-dimensional measurement of the welding points on the battery cells is done with the 3D laser triangulation method. A laser sensor moves over the entire length of the battery pack. The sensor throws fine lines of blue light on the top of the battery cells where the points for welding the connection strips are.

First, ultrasonic welding doesn't always produce a strong enough bond, and most importantly, a bond that penetrates all the way through tab. Ultrasonic welding also limits the total number of foils that can be used. This is significant because battery energy storage capacity increases with the number of foils.
