Thermal energy can be stored as sensible heat in a material by raising its temperature. The heat or energy storage can be calculated as. $q = V r c p dt = m c p dt$ (1) where . q = sensible heat stored in the material (J, Btu) V = volume of substance (m^3 , ft^3) r = density of substance (kg/m^3 , lb/ft^3) m = mass of substance (kg, lb)

This doesn't translate to long-term energy storage, but it demonstrates crystals can interact with energy in a specific way. o Heat Capacity: Crystals have varying capacities to store heat.
