Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including the US, Australia and Germany. Thermal energy storage is predicted to triple in size by 2030. Mechanical energy storage harnesses motion or gravity to store electricity.

The complementary nature between renewables and energy storage can be explained by the net-load fluctuations on different time scales. On the one hand, solar normally accounts for intraday and seasonal fluctuations, and wind power is typically variable from days to weeks [5]. Mixing the wind and solar in different degrees would introduce different proportions ...
