

On a high level, flywheel energy storage systems have two major components: a rotor (i.e., flywheel) and an electric motor. These systems work by having the electric motor accelerate the rotor to high speeds, effectively converting the original electrical energy into a stored form of rotational energy (i.e., angular momentum).

The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy E according to (Equation 1) $E = \frac{1}{2} I \omega^2$ [J], where E is the stored kinetic energy, I is the flywheel moment of inertia [kgm^2], and ω is the angular speed [rad/s]. In order to facilitate storage and extraction of electrical energy, the rotor ...

Falcon Flywheels is an early-stage startup developing flywheel energy storage for electricity grids around the world. The rapid fluctuation of wind and solar power with demand for electricity creates a need for energy storage. Flywheels are an ancient concept, storing energy in the momentum of a spinning wheel.

Energy storage flywheel systems are mechanical devices that typically utilize an electrical machine (motor/generator unit) to convert electrical energy in mechanical energy and vice versa. Energy is stored in a fast-rotating mass known as the flywheel rotor. The rotor is subject to high centripetal forces requiring careful design, analysis, and fabrication to ensure the safe ...

Flywheel energy storage systems (FESS) employ kinetic energy stored in a rotating mass with very low frictional losses. Electric energy input accelerates the mass to speed via an integrated motor-generator. The energy is discharged by drawing down the kinetic energy using the same motor-generator. The amount of energy that can be stored is ...
