A combustion reaction is a reaction in which a substance reacts with oxygen gas, releasing energy in the form of light and heat. Combustion reactions involve  $O_2$  as one reactant. The combustion of hydrogen gas producing water vapor qualifies as a combustion reaction:  $2 H_2 (g) + O_2 (g) \rightarrow 2 H_2 O (g)$ . The Hindenberg was a hydrogen-filled airship that suffered an accident ...

Thermal Storage. Many boilers employ thermal storage to improve efficiency by minimizing the amount of on-off cycling. This is usually a large, insulated metal tank (600 to 1500 gallons) that holds the heated water before circulating it through the house or building.

The Walltherm delivers energy to a storage tank, which then feeds the heating system. The heating system's pumps (for floor heating or radiators) must not run if the water in ...
