

What is seasonal thermal energy storage (STES)?

Analysis of relations between technical and economic parameters. Revelation of economic competitiveness of STES against existing heating options. Seasonal thermal energy storage (STES) holds great promise for storing summer heat for winter use. It allows renewable resources to meet the seasonal heat demand without resorting to fossil-based back up.

Does seasonal thermal energy storage provide economic competitiveness against existing heating options?

Revelation of economic competitiveness of STES against existing heating options. Seasonal thermal energy storage (STES) holds great promise for storing summer heat for winter use. It allows renewable resources to meet the seasonal heat demand without resorting to fossil-based back up. This paper presents a techno-economic literature review of STES.

Why is seasonal energy storage important?

Energy storage at all timescales, including the seasonal scale, plays a pivotal role in enabling increased penetration levels of wind and solar photovoltaic energy sources in power systems.

Is thermal energy storage economically viable?

The economic viability is assessed in terms of the levelized cost of heat (LCOH), storage volume cost, and storage capacity cost. The results show that the tank and pit thermal energy storage exhibits relatively balanced and better performances in both technical and economic characteristics.

How much does energy storage cost?

The energy storage cost varies from 4.6 to 50 US\$MWh⁻¹ without including dams in cascade and from 1.8 to 50 US\$MWh⁻¹ when including them (Fig. 2b,c, respectively). The water stored in a SPHS plant also benefits the dams downstream (in cascade).

How much does natural gas storage cost?

Assuming a cost for natural gas storage of 1 US\$ mcf⁻¹ 27 and an electricity generation efficiency of 50%, the cost of energy storage with natural gas is ~6.8 US\$ MWh⁻¹. This value is higher than the energy storage with SPHS in mountainous regions with cascade around the world (Fig. 2c).

We assess the cost competitiveness of three specific storage technologies including pumped hydro, compressed air, and hydrogen seasonal storage and explore the conditions (cost, ...

Underground hydrogen storage has the advantages of a large energy storage scale, long storage period, low energy storage cost, and high security, which can meet the energy storage demand of up to several months and can achieve TWh-level energy storage [9]. Therefore, co-planning short-term and seasonal energy storage accompanying with RES is of ...

The requirement for long term, large energy capacity storage with low utilisation is what makes seasonal storage an economic challenge. If sufficient value can be accessed through a seasonal price swing, the technology must then be able to store the volume of energy required and dispatch it at the required power capacity.

The addition of inter-seasonal energy storage solutions like ETES and hydrogen helps to reduce the size of renewable systems required to meet peak demand across seasons. ... Storage and delivery costs are two additional factors that support ETES as a more cost-effective solution for inter-seasonal storage compared to hydrogen. ETES generally ...

For methanol on the other hand, the storage is low enough cost to be used both for inter-annual as well as seasonal storage. It is built to cover 94 days of electricity demand. Download: [Download high-res image \(376KB\)](#)

Seasonal thermal energy storage (TES) has been utilized to mitigate this mismatch by storing excessive solar energy in summer and releasing it for space and water heating in winter when needed 9 ...

The water storage cost with seasonal pumped-storage varies from 0.007 to 0.2 \$/m³ of water stored (Fig. 4a). This large cost difference is due to the variation in topography and water availability. The energy storage cost varies from 4.6 to 50 \$/MWh without including dams

Inter-seasonal compressed air energy storage in aquifers (IS-CAESA) was first proposed by Mouli-Castillo et al. [7], who pointed out that safe storage of hundreds of millions of cubic meters of air is necessary if significant inter-seasonal storage is to be achieved. The IS-CAESA system is divided into a surface energy storage plant and an ...

This UK storage potential is achievable at costs in the range US\$0.42-4.71 kWh⁻¹. Compressed-air energy storage could be a useful inter-seasonal storage resource to support highly renewable power systems.

As discussed, LDS is used primarily to provide large amounts of inter-season energy storage, mostly discharging in summer. ... but do not provide cost-effective seasonal storage due to their high energy-storage capacity costs. Battery storage currently receives the vast majority of attention, investment, incentives, and mandates designed to ...

The concept of seasonal thermal energy storage (STES), which uses the excess heat collected in summer to make up for the lack of heating in winter, is also known as long-term thermal storage [4]. Seasonal thermal energy storage was proposed in the United States in the 1960s, and research projects were carried out in the 1970s.

Extreme weather events resulting from climate change have exposed vulnerabilities in the global heating and cooling infrastructures. According to the International Energy Agency (IEA), a record 2.5 GT of direct CO₂ emissions were produced from space and water heating of buildings globally in 2021 [1]. Furthermore, an additional 60MtCO₂ was ...

Mongird et al. have done a cost comparison analysis for the different storage technologies over a 10-hour duration of their usable life where it was concluded that compressed-air energy storage, pumped hydro storage and hydrogen energy storage are the most cost-effective technologies [19]. However, factors such as large capacity would hinder ...

As could be expected, these results highlight the importance of inter-seasonal energy storage when there is a high penetration of renewable power. ... The levelised cost of energy (both heat and electricity) is $\$42.48/\text{MWh}$, but the levelised revenue is $\$53.32/\text{MWh}$ so there is a profit of $\$10.83$ for every MWh of energy service demand satisfied.
