In the field of construction, the momentum wheel was usually used as a regenerative energy-storage battery to provide continuous power for the crane to transport the load [38,39]. By comparison, using the passive mechanism of the momentum wheel to rotate the suspended load, as the RCD does in this paper, has not been proposed or studied before.

The all-mechanical system from Swiss-based Energy Vault uses automated stacking and unstacking of blocks weighing up to 35 tons (one ton is 1,000 kilograms, about 2,200 pounds), all set in an open area with six crane arms (Figure 1). The sophisticated system uses advanced algorithms to decide what to stack where and also the optimum stacking order.
