This is not the case in circuits containing energy storage elements, i.e. inductors or capacitors, where the voltage is related to the current through a differential equation, resulting in a dynamic response of the circuit. In this type of circuits (dynamic circuits), information on the past is necessary to determine the response at any time.

Inductors are our other energy-storage element, storing energy in the magnetic field, rather than the electric field, like capacitors. In many ways, they exist as duals of each other. Magnetic field for one, electric for the other; current based behavior and voltage based behavior; short-circuit style behavior and open-circuit style behavior. Many of these comparisons can be made.
