The slenderness of the heat storage tank affects both the airflow velocity, and thus the heat transfer rate and air pressure drop. It also changes the heat conduction field in the rock material, which can significantly affect the heat storage efficiency and maintain the high exergy efficiency of the process.

However, because of the rapid development of energy storage systems (EESs) over the last decade such as pumped hydro-energy storage [22], compressed air energy storage [23], and liquid air energy storage (LAES) [24], an optimal solution could be to apply an EES to the LNG regasification power plant, thus allowing the recovered energy to be ...

CAES, a long-duration energy storage technology, is a key technology that can eliminate the intermittence and fluctuation in renewable energy systems used for generating electric power, which is expected to accelerate renewable energy penetration [7], [11], [12], [13], [14]. The concept of CAES is derived from the gas-turbine cycle, in which the compressor ...

One prominent example of cryogenic energy storage technology is liquid-air energy storage (LAES), which was proposed by E.M. Smith in 1977 [2]. The first LAES pilot plant (350 kW/2.5 MWh) was established in a collaboration between Highview Power and the University of Leeds from 2009 to 2012 [3] spite the initial conceptualization and promising applications ...
