The transition to a low-carbon electricity system is likely to require grid-scale energy storage to smooth the variability and intermittency of renewable energy. This paper investigates whether private incentives for operating and investing in grid-scale energy storage are optimal and the need for policies that complement investments in renewables with encouraging energy storage.

Energy storage. Energy storage. Storing energy so it can be used later, when and where it is most needed, is key for an increased renewable energy production, energy efficiency and for energy security. To achieve EU's climate and energy targets, decarbonise the energy sector and tackle the energy crisis (that started in autumn 2021), our energy
