But, the enormous storage of water at a dam causes the shifting of poles which leads to the change in earth's rotation [3]. To overcome these fluctuations in power generation and also meeting the required power demand, an efficient energy storage system is desirable [4].

The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy E according to (Equation 1)  $E = 1 \ 2 \ I \ o \ 2 \ [J]$ , where E is the stored kinetic energy, I is the flywheel moment of inertia [kgm 2], and o is the angular speed [rad/s].
