For additional benefits, the central heating system with electric thermal storage can be combined with a heat pump. There are numerous advantages to this combination: It provides a highly efficient, all-in-one heating and air-conditioning system that is fully electric.

Electric storage energy boilers take electricity as the energy and use resistance or electromagnetic induction heat. When the heat transfer part of the boiler is heated to specific parameters (temperature, pressure) when the heat transfer part of the boiler is heated Quality heat mechanical equipment is output outside.

The heating system includes cogeneration, electric boiler, heat exchange station, and heat network to meet the needs of users. The transmission of electric energy in the power system has the characteristics of real-time, fast and strong balance, and the storage of electric energy has the disadvantage of high cost and difficult storage.

E-boilers convert electrical power into steam or hot water, reducing the use of fossil energies and reducing CO2 emissions. As such, E-boilers systems are an indispensable link in the pursuit of a more sustainable production process.
