2 · Electric heating refers to any system that uses electricity as the main energy source to heat the home. It covers many types of heating, but for most people it would mean either storage heaters, electric boilers or underfloor heating. It would not normally be used to describe heat pumps, which do not use electricity to provide heating directly.

Electric Thermal Storage Heaters use low-priced electricity (off-peak periods) to store heat in their ceramic bricks; stored heat is then used later, typically during daytime. If the difference in the On/Off electricity rates is considerable, that can provide lower energy bills.

Defined as a technology enabling the transfer and storage of heat energy, thermal energy storage integrates with modern energy solutions like solar and hydro technologies. During off-peak electrical demand, chilled or hot water is generated and stored, later withdrawn and distributed during peak periods.
