

How regenerative braking system can recover energy in electric vehicles?

Regenerative braking system can recovery energy in various electric vehicles. Considering large computation load of global optimization methods, most researches adopt instantaneous or local algorithms to optimize the recuperation energy, and incline to study straight deceleration processes.

What is regenerative braking energy recovery system?

The actual vehicle test device is built and the actual road vehicle tests are carried out. The regenerative braking energy recovery system of pure electric vehicle is to recover and reuse the consumed driving energy under the premise of ensuring the braking safety.

What is braking energy recovery?

The act of recovering kinetic energy from electric vehicles during deceleration, transforming it into electric energy through the motor, and storing this energy in an energy storage device is known as braking energy recovery. Experts from both home and abroad have recently examined braking energy recovery technologies from numerous perspectives.

How kinetic energy can be recovered from an electric vehicle?

The vehicle kinetic energy can be recovered into the battery by switching from the electric motor to the generator. Research shows that approximately 30%-50% of the total energy of an EV in urban traffic is consumed on friction braking (FB) ,and 25%-40% of the braking energy can be recovered by regenerative braking (RB) .

Is there a braking energy recovery strategy for electric vehicles?

This work was supported by the National Natural Science Foundation of China (Grant Nos. 52275047, 51975048). Yang, C., Sun, T., Yang, L. et al. A novel predictive braking energy recovery strategy for electric vehicles considering motor thermal protection.

What types of energy storage devices are used for Regenerative vehicle braking?

We can classify the energy-storing devices used for regenerative vehicle braking into three categories: hydraulic energy storage devices (HES), flywheel energy storage devices , and electric energy storage devices [9, 10].

Regenerative braking is an important feature to increase the driving range of electric vehicles (EVs). For an autonomous EV, the deceleration profile and portion of regenerative braking torque can be control variables affecting the regenerative braking energy recovery. To design a control algorithm maximizing the energy recovery, knowledge of the ...

With increasing global attention to climate change and environmental sustainability, the sustainable development of the automotive industry has become an important issue. This study focuses on the regenerative braking issues in pure electric vehicles. Specifically, it intends to elucidate the influence of the braking force distribution of the front and rear axles ...

The recovery of braking energy is a very important technology for hybrid electric vehicles. When the internal combustion engine vehicle decelerates to a stop, the vehicle's kinetic energy is

In recent years, the EV industry has developed rapidly in China. In 2018, the sales volume of EV in China was 984,000 [1] aking energy recovery can improve energy utilization, reduce vehicle wear and braking heat, reduce noise, alleviate heat recession, optimize the braking performance of EV, and improve braking stability, which is one of the key ...

The regenerative braking energy recovery system of pure electric vehicle is to recover and reuse the consumed driving energy under the premise of ensuring the braking safety. In this paper, the regenerative braking energy recovery system of pure electric vehicle was optimized based on driving style, and the driver model is constructed and the parameters that ...

The fuzzy control takes into account multiple parameters, including vehicle speed, braking intensity, SOC, and the percentage of electric braking. By dynamically adjusting the ...

Designing and creating new energy efficient and cost-effective systems is an integral part of the development of the transport industry. An effective solution to the problem of high operational fuel consumption of vehicles is the improvement of braking energy recovery systems, which will significantly increase the range of the vehicle.

braking and verified that the braking energy recovery rate can increase 8 ~ 13% by reducing the inertia of the rotating parts. The aim of the regeneration control strategy of the electric vehicle is to ensure the recovery of braking energy as much as possible on the basis of ensuring the braking stability (He et al., 2012).

film capacitor in electric vehicle braking energy . recovery. 236-240 (2010) ... The paper also discusses a design concept of an energy recovery device in mechanical vehicles which uses torsion ...

The thermal decay of the brake has a great impact on the long downhill braking stability of pure electric commercial vehicles. Based on the road slope and using the fuzzy control method, the motor regenerative braking force and friction braking force distribution strategies were designed to reduce the friction braking force, improve the braking stability and recover the ...

Many manufacturers have produced different types of electric vehicles (EVs), such as battery electric vehicles (BEVs) [3], hybrid electric vehicles (HEVs) [4], and plug-in hybrid electric vehicles [5]. While energy-saving

and emission-reduction technologies related to EVs are being vigorously developed [6, 7], braking energy recovery is the key.

The adoption of electric vehicles promises numerous benefits for modern society. At the same time, there remain significant hurdles to their wide distribution, primarily related to battery-based energy sources. This review concerns the systematization of knowledge in one of the areas of the electric vehicle control, namely, the energy management issues ...

Efficient regenerative braking of electric vehicles (EVs) can enhance the efficiency of an energy storage system (ESS) and reduce the system cost. To ensure swift braking energy recovery, it is paramount to know the upper limit of the regenerative energy during braking. Therefore, this paper, based on 14 typical urban driving cycles, proposes the concept and ...

The recovery of kinetic energy (KER) in electric vehicles was analyzed and characterized. Two main systems were studied: the use of regenerative brakes, and the conversion of potential energy. The paper shows that potential energy is a potential source of kinetic energy recovery with higher efficiency than the traditional system of regenerative brakes. The study compared ...

The recovery of braking energy is a very important technology for hybrid electric vehicles. When the internal combustion engine vehicle decelerates to a stop, the vehicle's kinetic energy is ...

Regenerative braking system is a promising energy recovery mechanism to achieve energy saving in EVs (electric vehicles). This paper focuses on a novel mechanical and electrical dual-pathway braking energy recovery system (BERS) based on coil springs for energy saving applications in EVs. With the aims of maximizing energy recovery efficiency, ...

This paper takes pure electric vehicles as the research object, with the objective of achieving the improvement of vehicle energy economy and driving experience, and conducts a study on the regenerative braking energy recovery management of pure electric ...

Regenerative braking technology is essential for reducing energy consumption in electric vehicles (EVs). This study introduces a method for optimizing the distribution of deceleration forces in front-wheel-drive electric vehicles that complies with the distribution range outlined by ECE-R13 braking regulations and aligns with an ideal braking distribution curve. In addition, using a ...

PDF | On Sep 1, 2021, Chunhui Liu and others published Research on regenerative braking energy recovery strategy of electric vehicle | Find, read and cite all the research you need on ResearchGate

Classification of braking controllers by energy recovery abilities: BBS-blended braking system, FB-friction brake, EB-electrical brake. Conventional (a) and intelligent (b) braking algorithms.

Electric vehicle braking energy recovery device

The output power of the electric motor is used to overcome the internal resistance of the mechanical devices of the electric vehicle itself, as well as the power consumed by the external resistance determined by the driving conditions. ... Cong, M. Regenerative Braking Control Strategy to Improve Braking Energy Recovery of Pure Electric Bus ...

The basic principle of operation of the developed braking energy recovery system for electric vehicles is as follows. During vehicle braking, the control system switches device 3 to engine mode. In this case, the kinetic energy reserve of the flywheel accumulator increases.

Regenerative braking system can recovery energy in various electric vehicles. Considering large computation load of global optimization methods, most researches adopt instantaneous or local algorithms to optimize the recuperation energy, and incline to study straight deceleration processes.

Mechanism for regenerative brake on the roof of a ?koda Astra tram The S7/8 Stock on the London Underground can return around 20% of its energy usage to the power supply. [1]Regenerative braking is an energy recovery mechanism that slows down a moving vehicle or object by converting its kinetic energy or potential energy into a form that can be either used ...

The regenerative braking technology is an important method to increase the endurance range of the electric vehicle. During the braking process, the kinetic energy of the electric vehicle can be converted into electric energy and stored in the energy source device with the regenerative braking system, so the endurance range of the electric ...

Braking energy recovery (BER) aims to recover the vehicle's kinetic energy by coordinating the motor and mechanical braking torque to extend the driving range of the ...

In the braking scenario of an electric vehicle, the braking torque is derived from two sources: ... The aim is to verify the changes in energy consumption resulting from the installation of a brake energy recovery device in the vehicle. To begin, open MATLAB and input "advisor" in the MATLAB command line to launch the ADVISOR tool. ...

Regenerative braking uses an electric vehicle's motor as a generator to convert much of the kinetic energy lost when decelerating back into stored energy in the vehicle's battery.

In conclusion, the game theory-based optimized control strategy enhances energy recovery, braking stability, and driving comfort during the vehicle's braking process, leading to commendable performance. It achieves superior braking control in pure electric vehicles" braking procedures and enhances energy utilization efficiency.

A series hybrid engine has an electric traction motor drive of the vehicle wheels and a regenerative braking system that converts the motor to a generator for the output of useful electrical energy, the latter being used either to charge the storage battery for a power source for the traction motor, or if the battery is charged, diverting the regenerative energy to a resistive ...

As one of the key technologies to improve energy efficiency and extend the driving range of EVs, regenerative braking has attracted extensive attention. The aim of this ...

Regenerative braking system can recovery energy in various electric vehicles. Considering large computation load of global optimization methods, most researches adopt instantaneous or local algorithms to optimize ...

During braking or coasting, the kinetic energy from a propelling vehicle generates electric power back to the battery or other energy storage device is known as regenerative braking [61]. Regenerative braking is also known as kinetic energy recovery system .

Regenerative braking, which refers to transferring the kinetic energy of the vehicle during braking instances when riding on a road with negative slope to electrical energy and store it in the battery, can be considered as a viable solution for the energy problem . Regarding the topic of regenerative braking in EVs, numerous studies have been ...

This study investigates the efficiency and safety of regenerative brake energy recuperation systems for electric vehicles. A three-input single-output fuzzy controller is ...

To further improve the braking energy recovery efficiency of battery electric vehicles and increase the range of the cars, this paper proposes a multi-mode switching braking energy recovery control strategy based on fuzzy control. The control strategy is divided into three modes: single-pedal energy recovery, coasting energy recovery, and conventional braking ...
