Most of the assessed LIBs show good performance in all considered application cases, and LIBs can therefore be considered a promising technology for stationary electrochemical energy storage.

## Electrochemical energy storage roadmap

First established in 2020 and founded on EPRI's mission of advancing safe, reliable, affordable, and clean energy for society, the Energy Storage Roadmap envisioned a desired future for energy storage applications and industry practices in 2025 and identified the challenges in realizing that vision.

As a result, it is increasingly assuming a significant role in the realm of energy storage [4]. The performance of electrochemical energy storage devices is significantly influenced by the properties of key component materials, including separators, binders, and electrode materials. This area is currently a focus of research.
