

How emulsion pump station control system works?

The fluid supply line of emulsion pump station is modeled by AMESim software, and the pressure loss model is simulated and analyzed. The power matching control technologyis introduced into the pump station control system to judge the power demand of hydraulic support and optimize the output of emulsion pump station.

Can emulsion pump station control the fluid supply system at the working face?

The control method of emulsion pump station in the fluid supply system of the working face is the key to realize the stable fluid supply technology of the working face. In this paper, a new on-line adaptive learning technique is proposed to design the optimal tracking control of the fluid supply system at the working face.

What is emulsion pump?

Emulsion pump is one of the key equipment of coal mining working face. With the development of comprehensive mining technology of underground coal mine, the single machine power of emulsion pump station is increasing constantly. Domestic emulsion pump manufacturers have developed an emulsion pump with an installed capacity of 315KW.

Can emulsion pump control reduce energy consumption?

Ting and Hong 5 studied the coal mining face fluid supply system, and obtained a conclusion that controlling the start and stop of the emulsion pump based on pressure sensor can effectively reduce energy consumption. Zhao et al. 6 proposed an intelligent variable frequency speed control system to reduce the energy consumption of the station.

What is the emulsion pump capacity?

Domestic emulsion pump manufacturers have developed an emulsion pump with an installed capacity of 315KW. How to ensure the continuous safe and stable operation of emulsion pump is of great significance to the efficient and safe production of coal mine. It is urgent for the coal mine to operate the emulsion pump station safely and efficiently.

What happens if the volume loss of emulsion pump station is ignored?

Therefore, the fluid supply of a single hydraulic support is taken as the research object and other supports and related pipelines at the working face are ignored to analyze the column lifting process. If the volume loss of emulsion pump station is ignored, the output flow is equal to the product of rotational speed and displacement, that is

The circuit uses several accumulators to supplement pump flow because the dwell time is 45 sec. out of the 57.5-sec. cycle. Its 22-gpm fixed-volume pump operates on pressure during most of the cycle to fill the cylinder and accumulators. Without the accumulators, this circuit would require a 100-gpm pump driven by a

3. INTRODUCTION A Hydraulic Accumulator is energy storage device. It is pressure storage reservoir in which a non- compressible hydraulic fluid is held under pressure by an external source. The external source used can be a spring, a raised weight, or a compressed gas. The main reasons that an accumulator is used in a hydraulic system, is that the pump ...

The circuit in Figure 16-2 uses a fixed-volume pump and an accumulator unloading-and-dump valve. Placing a flow control at the accumulator outlet allows free flow from pump to accumulator and adjustable flow to system. Figure 1-10. Click on image for larger view. The circuit in Figure 1-10 has a minimum pressure of 2000 psi and a maximum pressure of 3000 psi. This pressure is the limit of most hydraulic components.

A hydraulic press generally consists of two parts: the body (mainframe) and the hydraulic system.. The most common structure of a hydraulic press body is shown in Figure 1-1-2. It consists of an upper crossbeam 1, a lower crossbeam 3, four columns 2, and 16 internal and external nuts forming a closed frame, which bears all the working load.

During operation, the main pump charges the accumulators to the pressure setting of the unloading valve. The pump is unloaded for the remainder of running time. For starting, the manual valve is opened, connecting the

combined output from the accumulators to drive the fluid motor. The hand pump recharges the accumulators in case of leakage.

This solution is only suitable for very small accumulators, as otherwise the spring and therefore the overall dimensions will be excessively large. On the spring accumulator, like on the hydropneumatic accumulator, the pressure drops on drawing the usable volume as a function of the hardness of the spring.

A hydraulic system accumulator pump consists of a vessel, known as an accumulator, which is filled with hydraulic fluid under pressure. The accumulator is connected to the hydraulic system and acts as a storage tank for the excess fluid. When the system requires additional pressure, the hydraulic fluid from the accumulator is released into the ...

The diagram below demonstrates how the accumulator is lined up for the surface stack. Please remember that the diagram is for learning purpose. It may or may not match with your rig configuration. However, the concept of it is the same. A: Pressure regulator is used to maintain pressure at annular side at 500-1500 psi

2. What size accumulator vessel do you need? To specify what size accumulator vessel a home needs, calculate the flow rate (l/min) of the outlets in the home that you want to run at any one time. You can then identify the correct accumulator vessel sizing to provide this flow rate for a minimum of nine minutes - the average length of a shower.
