

How can ice thermal energy storage reduce the cost of HVAC systems?

Many methods have been introduced to reduce energy consumptions and the costs of HVAC systems. Along with reducing the operating cost of HVAC systems, ice thermal energy storage (ITES) systems, also called the ice storage system (ice-ss or ISS), have significant advantages in decreasing the peak cooling loads and the capacity of chillers.

What is ice storage air conditioning?

Ice storage air conditioning is the process of using ice for thermal energy storage. The process can reduce energy used for cooling during times of peak electrical demand. Alternative power sources such as solar can also use the technology to store energy for later use.

What are ice-based thermal energy storage systems?

Ice-based thermal energy storage systems have a long history dating back to the zero emission, pre-electric days of the ice house. Carbon emissions entered the mix when people figured out how to deploy electricity to turn water into ice. Now the circle has come around again.

Why is ice storage important?

It helps to reduce the use of fossil fuels for heating purposes. It has been crystal clear to everyone that ice storage systems provide significant advantages in reducing cooling costs, balancing energy supply and demand profiles, and shaving peak loads.

What is a full ice storage system?

A full storage system minimizes the cost of energy to run that system by entirely shutting off the chillers during peak load hours. The capital cost is higher, as such a system requires somewhat larger chillers than those from a partial storage system, and a larger ice storage system.

Should you replace air conditioning with ice storage?

Replacing existing air conditioning systems with ice storage offers a cost-effective energy storage method, enabling surplus wind energy and other such intermittent energy sources to be stored for use in chilling at a later time, possibly months later.

During the freezing process, energy is stored in the ice as latent heat. When changing the state of aggregation, 80 times more energy can therefore be stored in the ice than would be possible in liquid water. When the ice melts, this energy becomes available again. The principle of thermal ice storage is based on this physical property.
