Three categories of TES are analysed: sensible, latent, and thermochemical heat storage. Sensible TES are a classical technology which is cheap and widespread. Water tank connected to solar thermal plants is the classical and simplest example for this TES category.

What is a typical storage temperature?

Each application requires different storage temperatures. While for buildings the typical temperature range is between 5 and 90 °C, for industries with process heat applications it is typically between 40 and 250 °C and for solar thermal power plants up to 600 °C.

Notably, the degree of disorder in the microstructure increases significantly. With the elongation of grinding period from 5 to 30 h, the grain size of the alloy noticeably decreases. This outcome can be attributed to the large amount of energy accumulated during ball milling, which renders the lattice structure unstable.
