The "meter," in this case, is a reference to the end-user's service meter that measures how much grid energy is being used by the residence, business, or other facility. Power generated by FTM systems must pass through that electric meter before reaching an end-user, hence power plants are "front of the meter."

Buildings must serve significantly more energy needs--such as grid services, EV charging, electric generation, space conditioning, energy storage, and resiliency--than before. Rapid EV adoption, if unassisted, could have significant and potentially negative effects on grid infrastructure and buildings operations.
