Flexible manipulator systems in specific applications such as space exploration, nuclear waste treatment, medical applications, etc., often have characteristics superior to conventional rigid manipulator systems. However, their elasticity and complex dynamics lead to difficulties encountered in control processes. Research on improving the structure of the ...

Request PDF | Energy Minimization Approach for a Two-link Flexible Manipulator | Robot motion planning between two given configurations in the time domain has a great impact on robotic applications.

For the FE model of the composite manipulator as shown in Fig. 2 (a), Solid186 layered solid element, which has eight nodes, three degrees of freedom ( $u_x$ ,  $u_y$ ,  $u_z$ ) at each node, is used. The geometry, coordinate systems and lay-ups are shown in Fig. 2 (b). The FE model of the SCBM consists of four layers and the orientations are defined for each layer.

First of all, the elemental kinetic energy as well as potential energy of each link are determined to find the

elemental mass and stiffness matrices. Thereafter, global mass and stiffness matrices are obtained. ... The case study of a two-link flexible manipulator is taken and its complete dynamic model is developed and validated in both the ...

This review thoroughly explores energy storage in GFSCs, examining energy storage mechanisms, advanced GF fabrication methodologies and process parameter modulation, and critical strategies for constructing optimal surface and structure profiles of GF electrodes.

Our robot experimental results show that the crossbeam angles of 10° and 30° lead to almost equally high energy-efficient locomotion (Figure 6) where the 10° angle shows the greatest contact area (Figure 6b). In contrast, the crossbeam angle of 120° shows lower energy efficiency, although still higher than the typical 90° angle.

The Cross Car Beam is a component in the vehicle under the instrument panel. It is support the steering column, airbags, and instrument panel. It help in the absorption of impact energy, minimization of steering wheel movement in case of a collision, reduction of cockpit vibration and providing strength and control of the steering wheel.

At a battery pack during vehicle testing, hot and low temperatures cause battery capacity loss. 32, 33 Besides, at low temperatures, the electrolyte's viscosity increases and decreases the ionic conductivity, while the IR increases because of the impedance of directional migration of chemical ions. Also, lithium-plating that appears on the graphite and other carbon ...

A hybrid-electric vehicle employs an IC engine combined with a smaller battery and an electric motor. On the other hand, a PHEV consists of a much larger capacity battery storage known as a rechargeable energy storage system (RESS). It is equally important to apply a stable drivetrain topology for greater efficiency.
