Flux is also proportional to J/I or energy per Amp. Energy stored in an inductor is given as $\frac{1}{2} LxIxI$. When I ask where is the energy stored in an inductor the answer is given that it is stored in the magnetic flux. The energy stored in the flux is LxI but the energy stored in the inductor is $\frac{1}{2} LxIxI$.

An inductor, also called a coil, choke or reactor, is a passive two-terminal electrical component that stores electrical energy in a magnetic field when electric current flows through it. An inductor typically consists of an insulated wire wound into a coil around a core.
