The energy storage device can only obtain power from the DER and supply power to the distribution network but cannot purchase power from it.

How to constrain the capacity power of distributed shared energy storage?

To constrain the capacity power of the distributed shared energy storage, the big-M method is employed by multiplying $U_{es,i}^{pos}(t)$ by a sufficiently large integer M . (5) $P_{es,i}^{min} U_{es,i}^{pos} \leq P_{es,i}^{max} \leq M U_{es,i}^{pos}$ $E_{es,i}^{min} U_{es,i}^{pos} \leq E_{es,i}^{max} \leq M U_{es,i}^{pos}$

Why is distributed energy storage important?

This can lead to significant line over-voltage and power flow reversal issues when numerous distributed energy resources (DERs) are connected to the distribution network. Incorporation of distributed energy storage can mitigate the instability and economic uncertainty caused by DERs in the distribution network.

Where is energy storage device installed in a distributed energy resource?

In this situation, the energy storage device is installed by the DNO at the DER node, which is physically linked to the distributed energy resource. The energy storage device can only receive power from DER and subsequently provide it to DNO for their use.
