Capacitors used for energy storage. Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.

These battery energy storage systems usually incorporate large-scale lithium-ion battery installations to store energy for short periods. The systems are brought online during periods of low energy production and/or high demand. Their purpose is to increase the reliability of the grid and reduce the need for other drastic measures (such as rolling blackouts).

The rapid development of the global economy has led to a notable surge in energy demand.
