

Should energy storage be co-optimized?

Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible. Goals that aim for zero emissions are more complex and expensive than net-zero goals that use negative emissions technologies to achieve a reduction of 100%.

Does energy storage capacity cost matter?

In optimizing an energy system where LDES technology functions as "an economically attractive contributor to a lower-cost, carbon-free grid," says Jenkins, the researchers found that the parameter that matters the most is energy storage capacity cost.

How can battery storage help reduce energy costs?

Simultaneously, policies designed to build market growth and innovation in battery storage may complement cost reductions across a suite of clean energy technologies. Further integration of R&D and deployment of new storage technologies paves a clear route toward cost-effective low-carbon electricity.
