

What is thermochemical heat storage?

Thermochemical heat storage is a technology under development with potentially high-energy densities. The binding energy of a working pair, for example, a hydrating salt and water, is used for thermal energy storage in different variants (liquid/solid, open/closed) with strong technological links to adsorption and absorption chillers.

What is sensible heat storage (SHS)?

What is thermal energy storage?

Trane disclaims any responsibility for actions taken on the material presented. Thermal energy storage works by collecting, storing, and discharging heating and cooling energy to shift building electrical demand to optimize energy costs, resiliency, and or carbon emissions.

What is heat storage in a TES module?

Heat storage in separate TES modules usually requires active components (fans or pumps) and control systems to transport stored energy to the occupant space. Heat storage tanks, various types of heat exchangers, solar collectors, air ducts, and indoor heating bodies can be considered elements of an active system.

What are the different types of thermal energy storage systems?

Thermal energy storage (TES) systems store heat or cold for later use and are classified into sensible heat storage, latent heat storage, and thermochemical heat storage. Sensible heat storage systems raise the temperature of a material to store heat. Latent heat storage systems use PCMs to store heat through melting or solidifying.
