When designing a solar system, select solar equipment that best serves your customers' needs. Many prospective customers may have questions about alternating current (AC) and direct current (DC), charge controllers, power inverters, and solar converters. Solar installers must understand and explain these critical topics to help the client make an informed ...

Types of Inverters. There are several types of inverters that might be installed as part of a solar system. In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels--a string--to one inverter. That inverter converts the power produced by the entire string to AC.

However, the term "converter" typically refers to an AC to DC converter (or a battery charger), while "inverter" refers to the process of changing DC power to AC power. Because RVs and boats do not always require an inverter, but always have a battery charger, the general term used for the battery charger was the converter.
