What happened at California's largest lithium-ion battery energy storage facility?

A fire at a California lithium-ion battery energy storage facility once described as the world's largest has burned for five days, prompting evacuation orders. The fire broke out on Wednesday at the 250MW Gateway Energy Storage facility owned by grid infrastructure developer LS Power in San Diego.

Are lithium-ion battery fires rare?

Lithium-ion battery fires are rare but have blackened the image of a clean energy technology essential to the energy transition. Such fires are difficult to put out because lithium-ion battery fires generate their own oxygen.

How much energy can a lithium battery store?

A single battery cell (7 x 5 x 2 inches) can store 350 Wh of energy. Unfortunately, these lithium cells can experience thermal runaway which causes them to release very hot flammable, toxic gases. In large storage systems, failure of one lithium cell can cascade to include hundreds of individual cells.

Can a lithium ion battery cause a fire?

Compromised lithium-ion batteries can produce significant amounts of flammable gases with potential risk of deflagration and fire. If a commercial or utility install, follow pre-plan and do not enter structure. Residential setting response, control power to the unit, ventilate the area, and protect exposures.

Does lithium-ion battery involvement affect fire growth rate?

The impact of lithium-ion battery involvement on fire growth rates suggests that when firefighters respond to these incidents, they should consider: Rapid fire growth. Explosion hazards. The potential for unburned battery gas in a ventilation-limited fire to increase the flammability of smoke, which can increase risk of backdraft.

battery caught fire at one of Queensland's first large-scale renewable energy storage sites.

Lithium-ion batteries are increasingly found in devices and systems that the public and first responders use or interact with daily. While these batteries provide an effective and efficient source of power, the likelihood of them overheating, catching on fire, and even leading to explosions increases when they are damaged or improperly used, charged, or stored.

AND FIRE? 9. CONCLUSION The stationary Battery Energy Storage System (BESS) market is expected to experience rapid growth. This trend is driven primarily by the need to decarbonize the economy and create more decentralized and resilient, "smart" power grids. Lithium-ion (Li-ion) batteries are one of the main technologies behind this growth.

Original story: Thousands of people in Escondido are affected by an incessant fire that sparked Thursday at SDG& E's Northeast Operations Center, a lithium-ion battery energy storage facility.

Not only are lithium-ion batteries widely used for consumer electronics and electric vehicles, but they also account for over 80% of the more than 190 gigawatt-hours (GWh) of battery energy storage deployed globally through 2023. However, energy storage for a 100% renewable grid brings in many new challenges that cannot be met by existing battery technologies alone.
