What is a pumped storage hydroelectric power plant?

A pumped storage hydroelectric power plant stores electricity by pumping water during off-peak times. In such a plant, the stored water can be utilized to generate electricity. The hydroelectric power plant can store electricity in Megawatts (MW) or even Gigawatts (GW). The potential and kinetic energy of the stored water is then converted into electric energy.

5. For a sensible heat storage system, energy is stored by heating a liquid or a solid. Materials that are used in such a system include liquids like water, inorganic molten salts and solids like rock, gravel and refractories. The choice of the material used depends on the temperature level of its utilization.
