

What is behind the meter energy storage?

All components of the electrical grid between the meter and the utility scale generation site are considered "Front of the Meter (FTM)." This includes but is not limited to transformers, energy storage, transmission lines, substations, grid scale solar and wind generation, and so on.

What is the difference between behind the meter and front-of-the-meter systems?

BEHIND-THE-METER VS. FRONT-OF-THE-METER While behind-the-meter and front-of-the-meter systems are integral parts of the energy mix, they serve different roles and impact energy users differently. Behind-the-meter systems allow customers to take control of their energy generation and use, offering potential cost savings and increased resilience.

What are the benefits of a behind the meter system?

Let's dive into the benefits. Behind the meter systems help to directly reduce the amount of energy purchased by the building, which is estimated to cut electricity bills costs by 80%. Behind the meter system allows the user to access electricity from renewable energy sources, typically both wind and solar.
