Battery energy storage systems (BESSs) have attracted significant attention in managing RESs [12], [13], as they provide flexibility to charge and discharge power as needed. A battery bank, working based on lead-acid (Pba), lithium-ion (Li-ion), or other technologies, is connected to the grid through a converter.

An energy storage system is composed by three main parts: i) the energy storage containers, e.g. the batteries; ii) the power conversion system, e.g. the power electronics; and iii) ancillary balance of plant components, e.g. cool-ing, protections, monitoring subsystems and etcetera. Power conversion system (PCS) is as important as the storage

There are various review papers that have discussed BESS, as shown in Table 2. For example, a review of the methods and applications for battery sizing was presented in Yang et al. (2018).
