

What is a power conversion system (PCS)?

The PCS is the intermediary device between the storage element, typically large banks of (DC) batteries, and the (AC) power grid. AC/DC and DC/AC conversion takes place in the power conversion system (PCS). The energy flows into the batteries to charge them or is converted to AC from the battery storage and fed into the grid.

What is a modular multi-level energy storage power conversion system?

It utilizes the modular structure of the modular multi-level converter, and connects the battery energy storage in its sub-modules in a distributed manner to form a modular multi-level energy storage power conversion system. By using the access of the energy storage unit, the grid-connected stability of the system can be improved.

How do you choose an energy storage system?

In general, the choice of an ESS is based on the required power capability and time horizon (discharge duration). As a result, the type of service required in terms of energy density (very short, short, medium, and long-term storage capacity) and power density (small, medium, and large-scale) determine the energy storage needs.
