

Could electrochemical energy storage improve robot design?

This use of electrochemical energy storage in hydraulic fluids could facilitate increased energy density, autonomy, efficiency and multifunctionality in future robot designs. An energy-dense hydraulic fluid is used to construct a synthetic circulatory system in a lionfish-like soft robot, enabling untethered movement for up to 36 hours.

Are energy storage systems a barrier to robot autonomy?

Energy-storage systems are among the most crucial limitations to robot autonomy, but their size, weight, material and design constraints can be re-examined in the context of multifunctional, bio-inspired applications. Here we present a synthetic energy-dense circulatory system embedded in an untethered, aquatic soft robot.
