

Should the energy storage industry shift to a predictive monitoring and maintenance process?

This article recommends that the energy storage industry shift to a predictive monitoring and maintenance process as the next step in improving BESS safety and operations. Predictive maintenance is already employed in other utility applications such as power plants, wind turbines, and PV systems.

Are large-scale battery storage facilities a solution to energy storage?

Large-scale battery storage facilities are increasingly being used as a solution to the problem of energy storage. The Internet of Things (IoT)-connected digitalized battery storage solutions are able to store and dynamically distribute energy as needed, either locally or from a centralized distribution hub.

What are the guidelines for battery management systems in energy storage applications?

Guidelines under development include IEEE P2686 "Recommended Practice for Battery Management Systems in Energy Storage Applications" (set for balloting in 2022). This recommended practice includes information on the design, installation, and configuration of battery management systems (BMSs) in stationary applications.

Can predictive maintenance be used to manage energy storage systems?

Part 1 of this 3-part series advocates the use of predictive maintenance of grid-scale operational battery energy storage systems as the next step in safely managing energy storage systems. At times, energy storage development in the electric power industry has preceded the formulation of best practices for safety and operating procedures.

How can energy storage systems improve the lifespan and power output?

Enhancing the lifespan and power output of energy storage systems should be the main emphasis of research. The focus of current energy storage system trends is on enhancing current technologies to boost their effectiveness, lower prices, and expand their flexibility to various applications.

Why is it important to extend the cycle life of storage systems?

Extending the cycle life and ensuring that the storage systems can withstand frequent cycling without significant performance degradation is important for economic viability. Energy is also lost during the process of storing and retrieving from storage systems due to conversion inefficiencies.
