

What is a sCO₂ power cycle?

To exploit the techno-economic benefits of CO₂, the power cycles usually operate partially or completely above the critical point and are referred to as sCO₂ (supercritical carbon dioxide) cycles.

How does SCO₂ work?

This configuration has been deployed previously in solar thermal power plants using sCO₂ fluid, where both the working fluid and the storage medium exchange heat in a heat exchanger while flowing in similar or different directions based on the configuration.

Is SCO₂ a good choice for electrical power generation?

Electrical power generation based on sCO₂ as the working fluid has the potential to yield higher thermal efficiencies at lower cost than state-of-the-art steam-based power cycles.

What temperature should SCO₂ be stored at?

For the high-temperature sCO₂ cycle, the cold storage operates between 16 °C and 400 °C, requiring either a combination of storage fluids or the use of a synthetic fluid such as Biphenyl/Diphenyl Oxide.

How efficient is a self-condensing carbon dioxide energy storage system?

Zhao et al. also studied a self-condensing compressed carbon dioxide energy storage system using a vortex tube, achieving a round trip efficiency of 53.45 %.

What is the maximum energy storage capacity for CSP?

The facility will feature a maximum temperature up to 550 °C, maximum test pressure of 25 MPa and flow rate of about 25 kg/s, with the maximum turbine testing capacity of 1.5 MW. A. Muto et al. describes a novel thermochemical energy storage technology, and its integration with sCO₂ power cycles for CSP.

The Solar Energy Technologies Office Fiscal Year 2021 Photovoltaics and Concentrating Solar-Thermal Power Funding Program (SETO FY21 PV and CSP) funds research and development projects that advance PV and CSP to help eliminate carbon dioxide emissions from the energy sector. On October 12, 2021, SETO announced that 40 projects were ...

Developing highly efficient and lower-cost, indirectly heated sCO₂ cycles will provide the technology base for more advanced, directly heated sCO₂ cycles for clean fossil energy conversion. In addition, these direct-fired cycles can produce a high-purity stream of carbon dioxide for use/reuse or storage.

A. Muto et al. [72] describes a novel thermochemical energy storage technology, and its integration with sCO₂ power cycles for CSP. The thermo-chemical energy storage is particularly new for integration in the

sCO₂-CB. The storage unit has MgO, which goes into reversible reaction with CO₂ during charging and discharging stages.
