

What are flexible energy storage devices?

To date, numerous flexible energy storage devices have rapidly emerged, including flexible lithium-ion batteries (LIBs), sodium-ion batteries (SIBs), lithium-O<sub>2</sub> batteries. In Figure 7E,F, a Fe<sub>1-x</sub>S@PCNWs/rGO hybrid paper was also fabricated by vacuum filtration, which displays superior flexibility and mechanical properties.

What is the mechanical reliability of flexible energy storage devices?

As usual, the mechanical reliability of flexible energy storage devices includes electrical performance retention and deformation endurance. As a flexible electrode, it should possess favorable mechanical strength and large specific capacity. And the electrodes need to preserve efficient ionic and electronic conductivity during cycling.

What is heat conductive silicone grease (hcsG)?

Heat-conductive silicone grease (HCSG), one of the most common composite thermal interface materials (TIMs) used in many advanced applications, is limited by its low thermal conductivity (TC). Different surface modification agents are required to improve the dispersion of TC additives and the interfacial compatibility with the silicone matrix.

Which poly(ethylene terephthalate) sheets are used as flexible substrates?

Two flexible poly(ethylene terephthalate) (PET) sheets were used as flexible substrates. The Ni/Fe cell exhibited an energy density of 100.7 Wh kg<sup>-1</sup> at 287 W kg<sup>-1</sup>. Moreover, the cell also shows good cycling stability with a capacity retention of 89.1% after 1000 cycles.

Why is silicone based flexible paper used as a supporting film?

A mechanically-durable, silicone-based flexible paper was used as a supporting film because an oxygen-plasma treatment could easily modify its surface wettability. Furthermore, the surface roughened by plasma irradiation is expected to improve adhesion to the electrode composite by the anchor effect.

What is the optimal irradiation time for silicone sheets?

The weight of the transferred manganese dioxide composite and the remaining composite on the silicone sheet were measured and the residual ratio was calculated to be 5% for 3 s-treated paper. As the irradiation time increased to 5 s, the residual ratio increased to 8%, so that the optimal irradiation time was determined to be 3 s.
