

Why do we need a transformer in a power system?

In general, in the power system, traditional transformers are used to step up/step down the voltage. But these transformers do not have the ability to compensate for voltage sag and swell, reactive power, fault isolation, and so on. But with SST we will be able to overcome these drawbacks.

Why do we need a solid-state transformer?

Because the solid-state transformer (SST) can solve these problems in the distribution network not only by facilitating controlled bi-directional distribution of active and reactive powers, but also can provide a robust DC bus to isolate the disturbance on both sides of the transformer. 2

Do Transformers store energy?

Separate primary and secondary windings facili-tate high voltage input/output isolation, especially important for safety in off-line applications. Ideally, a transformer stores no energy-all energy is transferred instantaneously from input to output. In practice, all transformers do store some undesired energy:

Are solid-state transformers a suitable alternative to conventional transformers?

In this regard, solid-state transformers have been proposed as a suitable alternative conventional transformers. Solid-state transformers are among the equipment based on power electronic converters that in addition to better performance than conventional transformers provide a variety of other services.

How intelligent transformers work?

It should be noted that intelligent transformers by applying telecommunication linksconstantly monitor the grid, and in case of any disturbance in the grid, immediately operates in islanding mode, thus ensuring the continuity of load service, which will increase the reliability, stability, and efficiency of the system.
