**How Thermal Energy Storage Works.** Thermal energy storage is like a battery for a building's air-conditioning system. It uses standard cooling equipment, plus an energy storage tank to shift all or a portion of a building's cooling needs to off-peak, night time hours. During off-peak hours, ice is made and stored inside IceBank energy storage tanks.

Thermal Energy Storage tanks work by producing thermal energy (chilled or hot water) and distributing it to the facility during peak periods by warm and chilled water entering and exiting the tank through diffusers at the top and bottom of the tank. The diffuser system is designed to minimize turbulence and allows stratification of the water.
