Most projections suggest that in order for the world's climate goals to be attained, the power sector needs to decarbonize fully by 2040. And the good news is that the global power industry is making giant strides toward reducing emissions by switching from fossil-fuel-fired power generation to predominantly wind and solar photovoltaic (PV) power.

Gravitricity, a start-up based in Scotland, is developing a 4 to 8 megawatt mechanical energy storage project in a disused mine shaft. Its technology operates like an elevator, using excess electricity from renewables to elevate a solid, densely packed material. The denser the material, the greater the energy storage capacity.

The challenge: Solar and wind power may be clean and cheap, but coal and natural gas have them beat when it comes to consistency -- we can always burn more fossil fuels, but we can't force the sun to shine or the wind to blow whenever the grid needs more electricity, like exceptionally hot days or cold nights. Some solar and wind farms now store ...
