How does Thermal Storage Energy Work? At nighttime during off-peak hours, the water containing 25% ethylene glycol is cooled by a chiller. The solution gets circulated in the heat exchanger within the ice bank, freezing 95% of the water that surrounds the heat exchanger in the ice bank, freezing 95% of the water that is present around the heat exchanger in the tank.

The kinetic energy of a high-speed flywheel takes advantage of the physics involved resulting in exponential amounts of stored energy for increases in the flywheel rotational speed. Kinetic energy is the energy of motion as quantified by the amount of work an object can do as a result of its motion, expressed by the formula: Kinetic Energy = $\frac{1}{2}mv^2$...
